

## **Biosketch**

Carlos Sacristán López earned his PhD from the Instituto de Biología Funcional y Genómica (IBFG) in Salamanca, where he studied the intracellular trafficking of cell wall proteins in yeast. In 2013, he joined Geert Kops' laboratory at the Hubrecht Institute in Utrecht, the Netherlands, to investigate the mechanisms underlying chromosome segregation. Throughout his career, he has worked on various aspects of the spindle assembly checkpoint and kinetochore architecture. Currently, as a research associate, he leads a research program focused on the structure of centromeric chromatin. His work has been published in leading journals, including *Science*, *Nature Cell Biology*, and *Cell*.
